# **The New North: Patents and Knowledge Economy Analysis in Alaska**

**Salma Zbeed & Andrey Petrov**

Department of Geography  
ARCTICenter  
University of Northern Iowa

# Introduction

- Alaska, as many other northern regions, is not typically considered a ‘hotbed’ of knowledge economy.
- The petroleum sector and the government play the commanding role in the state’s economic structure.
- Lowering oil prices, diminishing production and government budget cuts ignited a discussion about “other options” and “new money” for Alaskan economy.
- The modern economic development theories suggest that investment in knowledge-based economy and human capital is necessary.
- Geographic proximity between people and organizations that create knowledge is still in the core of region’s ability to nurture a successful regional innovation system.

➤ **Knowledge gaps:**

- Little knowledge about spatial distribution of patents and typological characteristics of innovation in Alaska.
- Limited understanding of external and internal innovation networks within the Alaska Regional Innovation System (AKRIS).
- Possible factors that influence innovation activities in Alaska and the relationship between innovation, creative capital and economic development in Alaska have not been examined

# The Research Objectives and Goals

- **Goal:** Analyze the knowledge economy in Alaska and elucidate its role in the economic development in the area.
  
- **Research objectives:**
  - Determine the spatial distribution of patents, temporal dynamics and typological characteristics of innovation in Alaska.
  
  - Elucidate the external and internal innovation networks within Alaska Regional Innovation System (AKRIS).

# Why Patents in Alaska?

- In Alaska, there have been very few studies of knowledge economy and creative economy.
- Knowledge is expected to add a substantial value to economic production though enhancing the productivity and merging of new ideas and technology.
- Patents are usually considered as a good measure of knowledge economy.
- This study uses patents to provide the first cut analysis of knowledge economy in Alaska and clarify its role in the economic development of the state.

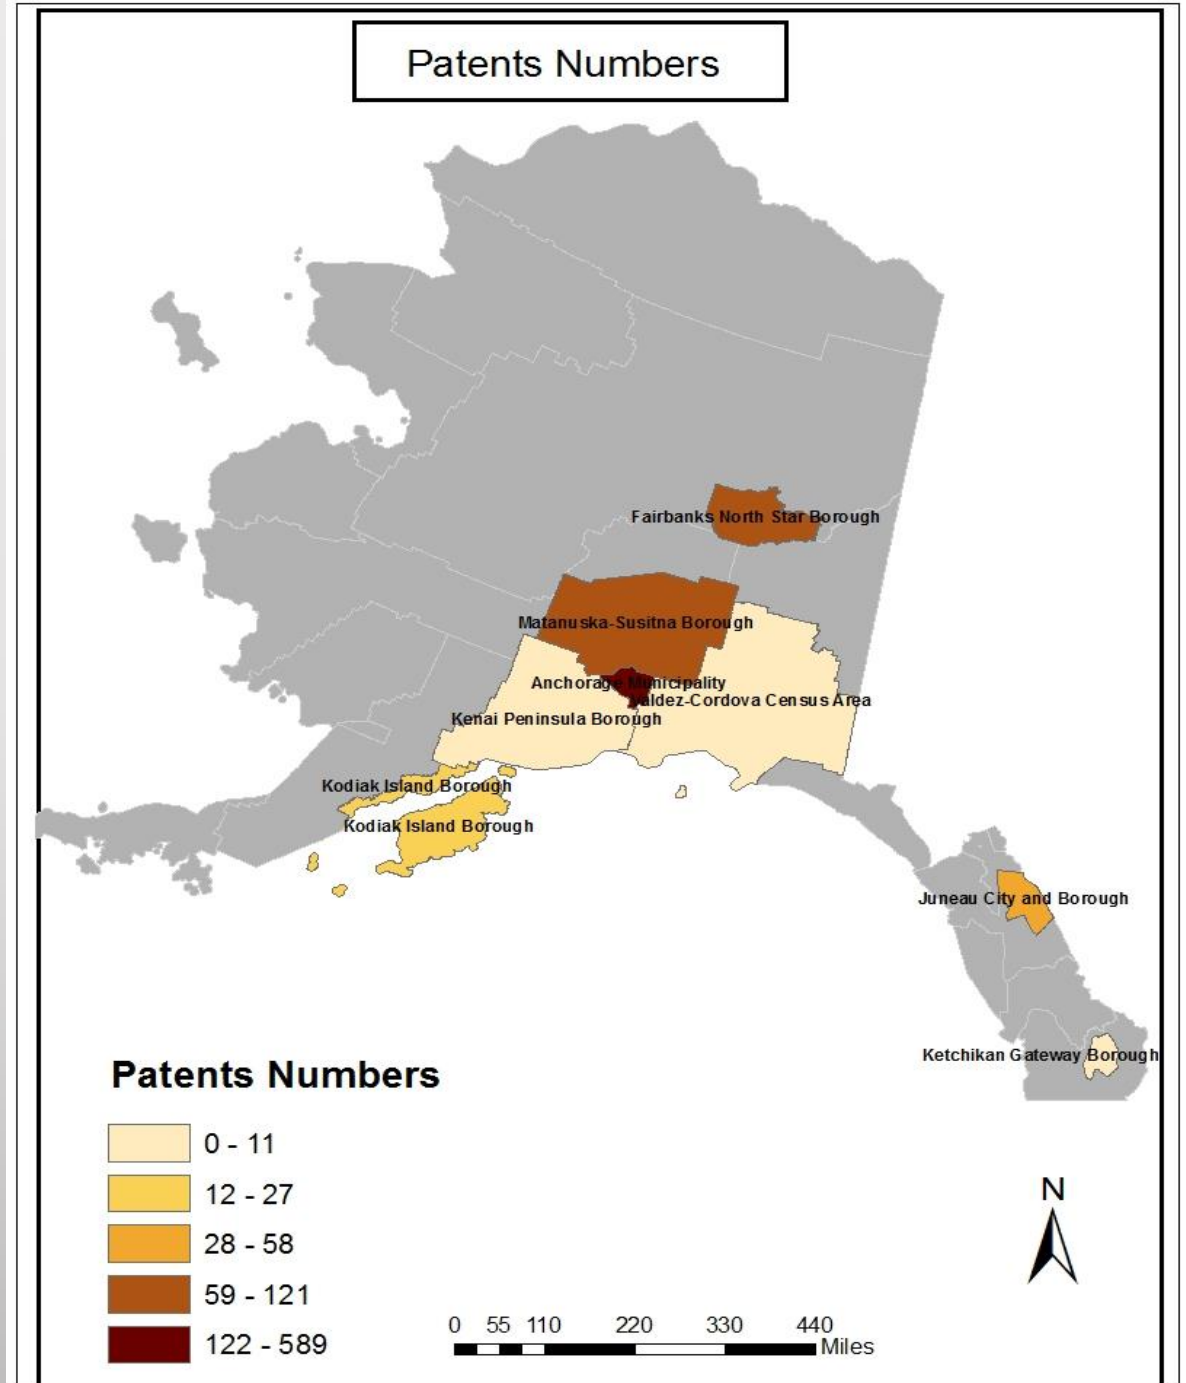

# Literature Review

## Patents Analysis

- A primary tool to study innovation
- Patents are usually considered as a representing knowledge economy output (Feldman, 2000).
- In the USA, patents granted by US Patent and Trademark office (USPTO) depends on examining inventions (Kogler, 2014).
- Number of patents in a certain area refers to the knowledge economy 'outcomes' in that area
- Patents have been known as an indicator of innovation and R&D process (Henderson R. et al, 1993).

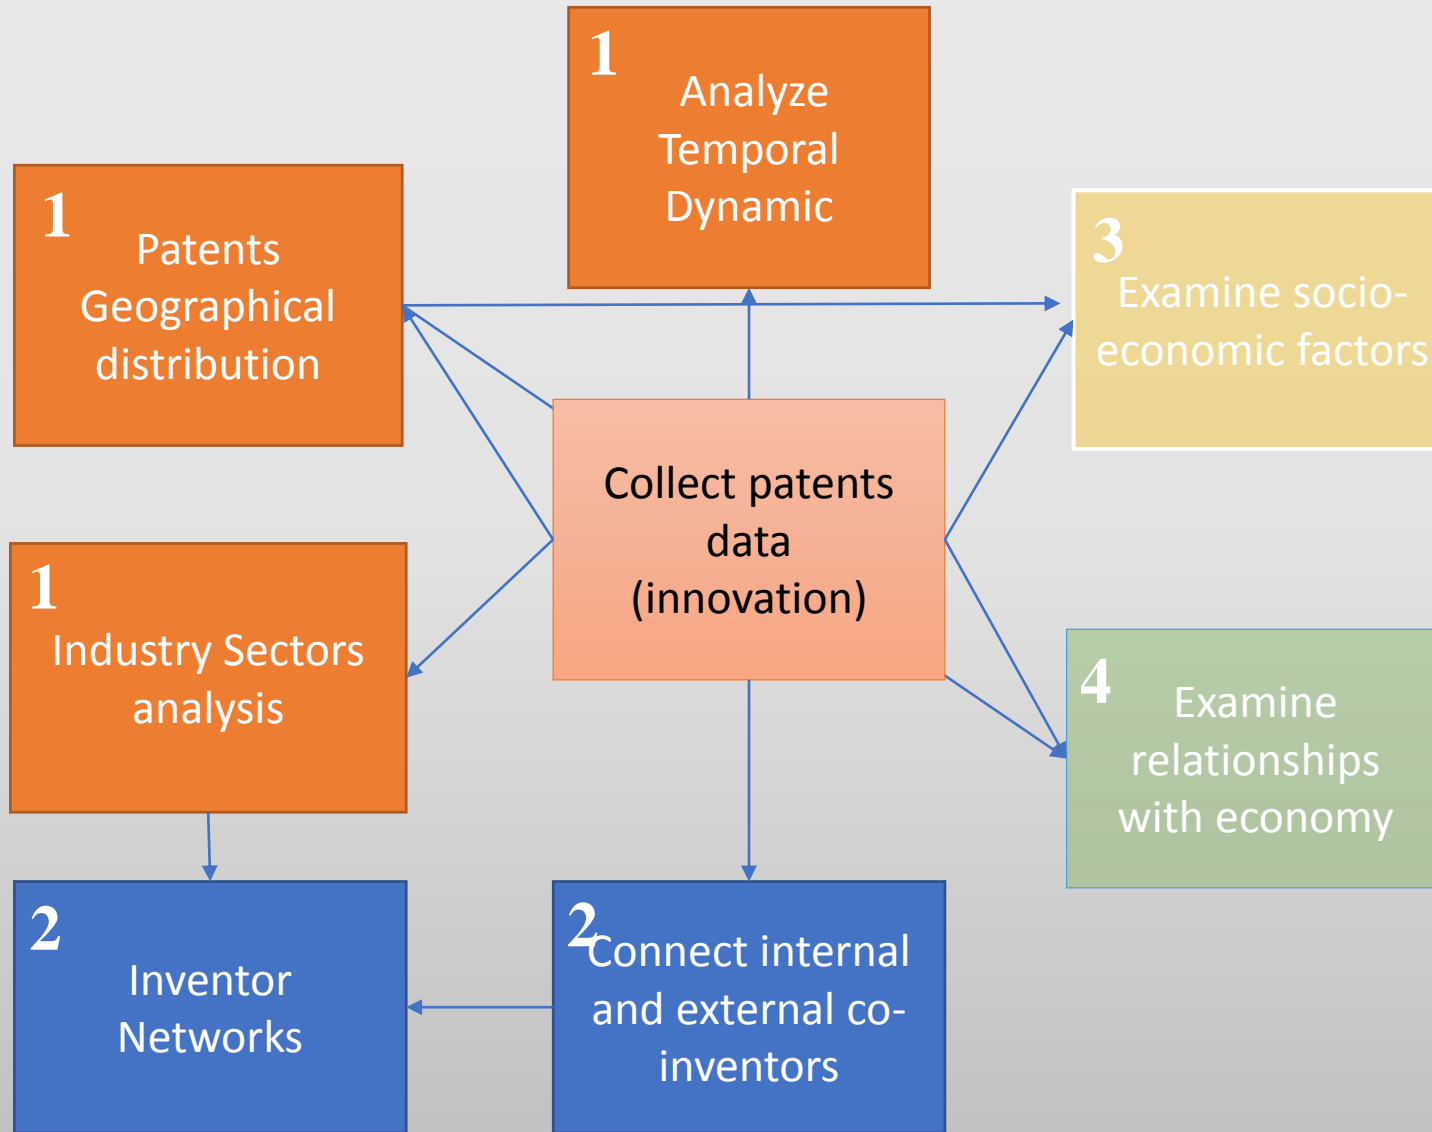

# Study Area

- The research study area is Alaska Boroughs that have a record of patented innovations.
- 8 Boroughs recorded patent counts totaling 1,077 patents created by 1,870 inventors between 1976-2010.
- The top *three cities* have largest number of patents in AK:
  - Anchorage
  - Fairbanks
  - Wasilla

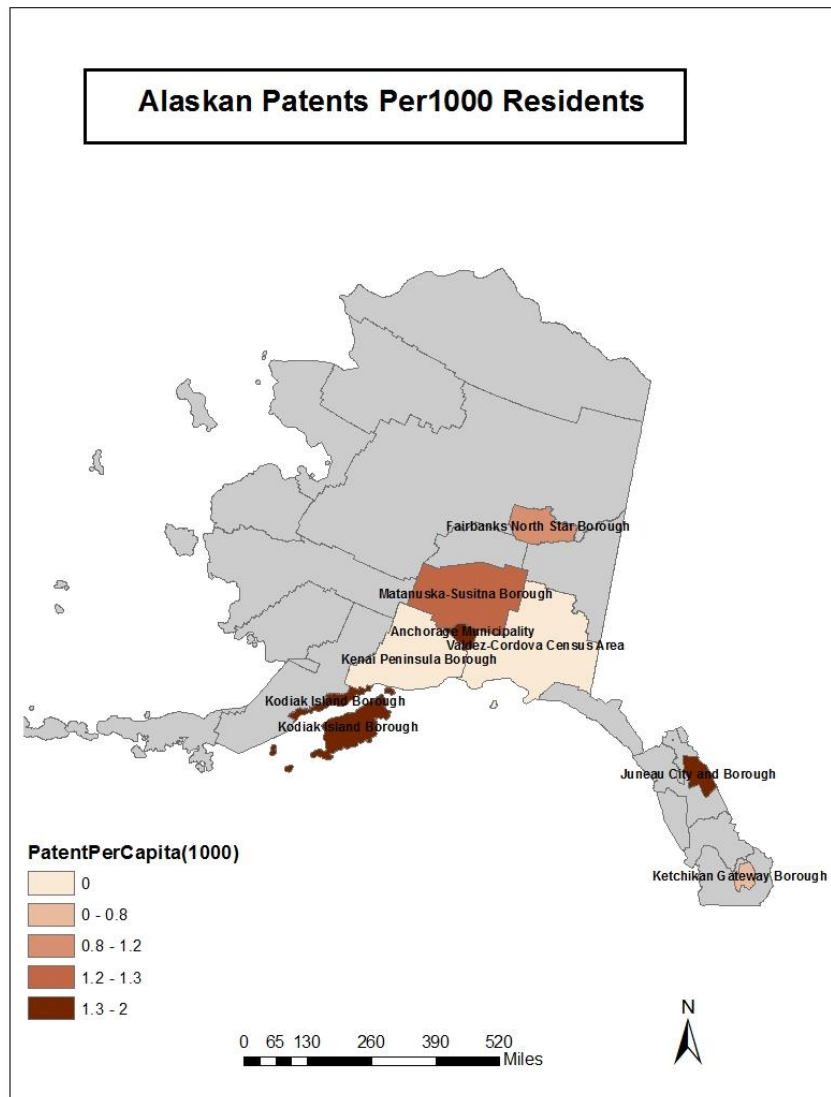

# Methodology

## Results

➤ The results show that Alaska has considerable patent activity, especially in some locations.

➤ Anchorage, Fairbanks, and Wasilla lead in the number of patents granted between 1976 to 2010.

# Annual Number of Patents and Inventors, and Average Team Size per Patent.

# Top Patented Industry Sector in Alaska

# Location quotients of sectoral patent output from 1976-2010

$$LQ_i^j = \frac{A_i^j / \sum_{i=1}^n (A_i^j)}{B_i^j / \sum_{i=1}^n (B_i^j)}$$

- If LQ =1 industry has the same share of activity as it does in the reference area.
- If LQ>1 reflects the relative concentration of specific activity in the region compare to nation.
- If LQ<1 reflects that the sector is underrepresented of the region of interest compare to national share.

# Conclusions

- The results show that Alaska has considerable patent activity especially in some fields.
- Wells industry sector was dominant by the patents number comparing with other industry sector.
- New industry sectors have recorded patents recently like data processing industry sector and surgery sector.
- Co-inventors network have been expanding over the time and the percent of patents share from external regions increased and diversified.
- Organizations (big outside companies) have a dominating effect on patents and innovation process.
- Alaska RIS evolved from an isolated system almost exclusively represented by individual inventors and small teams to a relatively diversified large-team based externally-connected RIS
